

Dawie de Villiers

Senior Angular Web developer

Details:

12 Kershout,
Eureka park
Grootbrak
Western Cape
6525

Level: Senior
Area: Remote
Experience: 12 years

Qualifications

Formal

BSc Information Technology
North West University, 2015

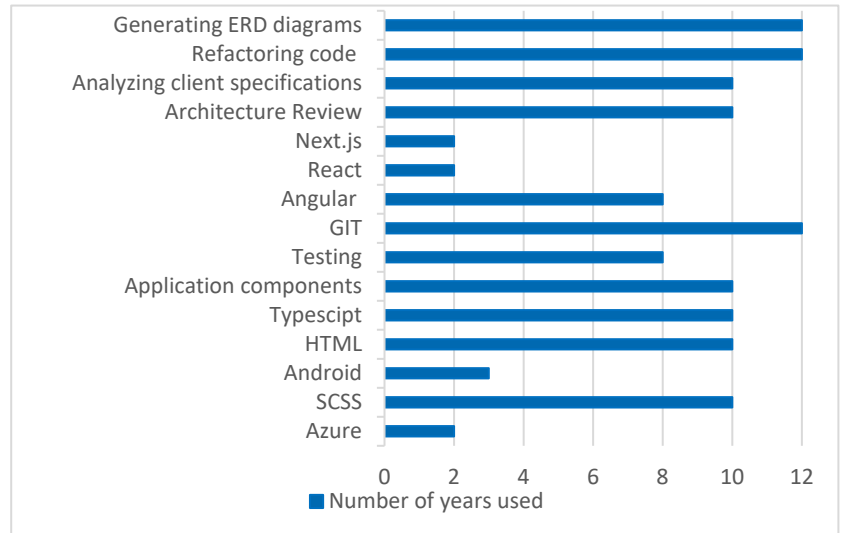

Online

Angular the complete guide – Udemy

Profile

Senior Web developer with extensive experience in Angular 4 – 22, Recently worked with other SPA libraries such as React and Vue, Have managed and lead teams in high enterprise corporations and also trained junior developers. I have a knack for responsive front-ends and I have a passion for making UI's elegant and appealing to work with.

Skills Matrix

Career Chronology

SonataOne (Previously IDR) , Senior Angular Front-end Developer, React web developer

Aug 2023 – April 2026

Momentum (Through DVT) , Lead Front-end Developer, Web chapter representative

Jan 2021 – 2023

Allegiance Consulting, Front-end Developer

Mar 2017 – December 2020

Gendac, Web Developer

Feb 2016 – Feb 2017

iFluid Development, Lead Senior Mobile Developer

Mar 2015 – Jan 2016

Business Connexion, Developer

Jan 2013 – Mar 2015

Employment details

Sonata One (IDR)		Aug 2023 – April 2026
Role:	Senior Angular developer and React developer	
Duties:	Maintained and developed Angular and React web components and refactored old Angular and Angular JS code to be aligned with new company architecture and requirements	
Project Description:	Angular 16 Project that was hosted inside a ASP.NET MVC shell, the project was hosted as a separate intermediate page transitioning the old system (Angular JS) to the new Angular 17 project template. While I was at the company the tech direction changed from Angular to React and a new project was created using React as the component library and Next.js as the framework. Learned allot about server side rendering and React components. Learned allot about Next.js and the React workflow, hooks state management, refs etc After my tenure using React and Vue I prefer Angular as I feel it is easier to scale, easier to manage and does not have as many external dependencies.	

MOMENTUM		MAR 2021 – March 2023
Role:	Lead Front-End Developer & Web chapter representative	
Duties:	Lead Front-End Developer: Analyzing client requirements, product design feasibility analysis, business logic troubleshooting, responsive design, responsive implementation. Web chapter representative: Skills transfer, upskilling of fellow developers, planning of dev guild sessions, creating team repositories, assessing Angular developers' competence and skillset.	
Project Description:	Angular 12 project that interfaces with a GraphQL backend VIA Next: VIA Next is the next generation of the momentum VIA platform.	

VIA is a way for advisers to view and edit clients, track leads and business applications progress, upload and download documents and view a clients Momentum Client 360 profile. It is a tool to provide a holistic view of your clients to enhance their lifetime financial wellness with Momentum.

The challenge with the new VIA was that we had to have a way for teams to independently build components used in VIA and be able to test and deploy them in their own environments. We used a micro frontend approach using Angular Elements to create web components embedding them in our container Angular application. We have already built the POC utilizing Google Analytics and we are interfacing with the various VIA API's using GraphQL as the data orchestration BFF (Backend-for-frontend).

The third-party libraries utilized in this project were among others:

Highcharts - <https://www.highcharts.com/>

Google Analytics – <https://developers.google.com/analytics>

Angular OAuth OIDC - <https://github.com/manfredsteyer/angular-oauth2-oidc>

NG Particles - <https://www.npmjs.com/package/ng-particles>

ALLEGIANCE CONSULTING	MAR 2017 – 2020
Role:	Lead Front-End Developer
Duties:	Built the entire front-end of the application, client interactions, support
Project Description:	PPS Horizon: This was a project he was part of building for PPS Investments, From the PPS website: “PPS Horizon gives you objective advice based on the information you provide. This means you have a holistic view of what’s possible, which is perfect for guiding you as you deal with your adviser.” It’s a tool used for financial and retirement planning Used Angular on the project, refactored the project to do network speed induced module pre-loading, also learned allot in terms of the capabilities of the Angular platform, the animation DSL, Using Redux for state management and also utilizing observables and sub-routing The hardest part of this project was making it mobile ready, as we were told this was a requirement after the desktop version was created

The third-party libraries utilized in this project were among others:

Parallax.js - <https://matthew.wagerfield.com/parallax/>

Redux - <https://redux.js.org/>

Highcharts - <https://www.highcharts.com/>

Charts.js - <https://www.chartjs.org/>

GENDAC	
FEB 2016 – FEB 2017	
Role:	Web Developer
Duties:	Focusing on MVC projects and projects that utilize Angular JS for the front-end

IFLUID DEVELOPMENT	
MAR 2015 – JAN 2016	
Role:	Lead Senior Mobile Developer
Duties:	Working as the lead senior mobile developer in Android
Project Description:	eDisco: edisco was an application that was used to teach students isiXhosa in a university setting. The application had three different ways of completing the lessons that were downloaded onto the device. The lesson types were Silent - No audio was played and the word with an image was displayed for the user to answer Listen - The user has to answer and then audio plays back the correct answer Speak - The user has to answer correctly like the silent and audio lessons but also has to speak the isiXhosa word into the application where the application uses the Pocket Sphinx library to decode the word and then feedback is provided to the user This project taught him to utilize voice recognition libraries namely Pocketsphinx and this was very valuable for him personally. Setting up the library was tricky at first and the debugging took allot of time but in the end the accuracy was quite remarkable. Project features:

Logging into the application

Downloads the user's audio files from the server

Downloads the user's image files from the server

Download the user's lesson objects in JSON format from the server

Creates lessons for the user from the downloaded lesson objects

Offline functionality and login capabilities

Sends the users completed lesson scores to the server if it has a connection, otherwise it saves the scores for the user on the tablet and then when the user has a connection on the next login it sends it to the server.

Synchronizes the scores on the device with the scores from the server on login

Deletes old lessons if they are no longer assigned to the user and the scores have been sent to the server

Recognizes the correct word in the speak lesson type for the application

Project Description:

Study Hall:

Study Hall was for an education program designed to let children download and do exam papers and then the students can get the paper marked and scores are sent to the server

They were planning on creating three different versions of the application and while very similar in the way they work, did most of the development on all the versions

Project features:

Logging into the application

Downloading the lessons for the user

Downloading the lesson images for the user

Download user profile data

Offline functionality and login capabilities

Buy tokens through the application and then purchase additional lessons with the tokens purchased

View and update your profile data

Automatic marking (in the case of questions with absolute answers such as multiple choice, match columns etc.) and manual marking where the user has to determine if his/her answer is correct with regards to the correct answer provided from the service

BUSINESS CONNEXION		JAN 2013 – MAR 2015	
Role:		Developer	
Duties:		Mainly developed applications for the Windows phone mobile platform aswell as developing some hybrid mobile applications using, Cordova, Rhomobile, Codenameone and Xamarin	
		Main focus was Windows phone and Android development	
Project Description:		Kids Aid:	
		Kids First Aid mobile application:	
		Children are irreplaceable and accidents happen when you don't expect them. The First Aid app empowers you as parent to have first aid information available to you anywhere, anytime	
		Description:	
		The Kids First Aid App empowers people and parents to have critical first aid information available to them anywhere, anytime.	
		With step-by-step instructions users are guided to ensure that when in need of emergency medical assistance, for children, spouses and friends and family. They receive the most effective treatment for the most effective results	
		App Features include an interactive interface that guides the user according to the emergency situation, voice guided walk-through for CPR situations, uses the device's GPS to provide the closest hospitals to the user's location, South African relevant emergency numbers that calls directly from the app and information on possible training courses brought to you by EMT South Africa	
		Project features:	
		Provides detailed instructions on how to treat: Electric shock, Stings, Seizures, Broken bones, CPR, Choking, Burns, Clinical Shock, Bites, Fever, Dog Bites, Eye injuries etc.	
		Can call Emergency numbers from the application	

Voice guided tutorial for Choking and CPR also included.

GPS to find the nearest hospital if you have an iPhone, Android Phone, or Windows 8 phone (Windows 7 not available)

Project Description:

Engen:

The Engen project was a project that was meant to show Engen clients Engen garages in their immediate location and then give the user the option of navigating to the location or viewing the particulars of the Engen garage

The data that could be viewed was the different facilities available e.g., Toilets, Wimpy, Steers, Bakery, Car wash etc. and also the contact details of the manager of the garage

The product was completely developed and tested but because of internal issues they never released it completely. Attached some screenshots of the Windows phone version he worked on

Project features:

Ability to locate your nearest Engen Garages in a 10km radius

Ability to view the Engen's features as well as contact details of the manager of said Engen on the map

Ability to call emergency numbers from the application as well as save your own Emergency numbers if you so desire

Ability to view specials relating to all Engen's on the application

Check in feature that calculates how far you are from the Engen on the map and then if you are within the 1km range you get a check in token which you can redeem for specials or discounts at the Engen in question (This is where there was internal conflicts at Engen, since not all the Engen owners were aware of the application and this intended tokens feature)

Ability to provide feedback and rate the Engen that you checked into

Project Description:

Power Of X:

Power Of X was a project developed for internal BCX use to be later rebranded and used in other companies for promotion of employee sales

The Power of X is a social selling tool that is powered by you – the employee. It is exclusively available to all employees who are part of the Business Connexion Group. The initiative is available across our entire footprint (South Africa, Africa, UK and Dubai)

was mostly a Windows phone developer as can be seen from his previous projects, did do allot of development on the Android platform for Power Of X, did most of the service calls, built screens and wrote the majority of the code to successfully “Post a lead”

The project wanted to target the Android and iOS platforms first so this gave him a great opportunity to actually learn Android and move away from the Windows phone platform which did not have meaningful market share in his opinion

The Android Power Of X application was nearing completion and so he was put on the Windows phone Power Of X application to develop it to reach the next release date for the Windows and Blackberry platforms.

Developed Windows phone application

Project features:

Logging into the application

Sending messages about products and leads

Posting or creating a lead (lead refers to a potential product or service procurement by a client of BCX can be an existing client or a new client)

Editing the lead

Discussing the lead

View BCX news

Searching for products or services via the application

Checking your commission for a posted lead

Checking the lead status i.e. Declined, Approved, Pending
